The judged experience

ULLDE:VERSE turns a canonical narrative state into a mobile investigation dossier. The public demo is available without login, credentials, API key or runtime model call.

1. A case, not a chat

The player enters a readable world with objective, pressure, place and known characters.

2. A visible commitment

A concrete decision highlights before execution, so confirmation is explicit.

3. Consequences that persist

After one action, the location changes from the cell to the cistern corridor. The route gains a new step, Miquel becomes known and pressure advances.

The same canonical state controls later options, characters, evidence, resources, relationships and endings.

90-second judge path

Open the public demo, keep **Corto guiado** selected, choose **Jugar este mundo**, then select **Sacar a Mateu de la celda y llevarlo primero a la cisterna**. The selection changes visibly before execution. After pressing **Ejecutar**, inspect the new location, route and known character.

Meaningful Build Week extension

Project DM existed before the Submission Period as a private experimental engine with prototype worlds and evolving factory contracts. The submission does not claim that baseline as Build Week output.

PRE-EXISTING BASELINE	EVALUATED BUILD WEEK EXTENSION
Experimental local narrative engine Prototype and unrelated worlds Private runtime state and workshop material Evolving contracts and prompts	Curated vertical-slice repository Project DM / ULLDE:VERSE identity Mobile dossier redesign and visible choice state Fictionalized names and portraits No-login deterministic browser runtime Production deployment package Security, repository and hosted-artifact QA English submission and judge documentation

Dated public extension trail

COMMIT	RESULT
91c339e	Curated submission baseline and reproducible vertical-slice repository
4a071fb	Contest interface, identity and privacy-facing content polish
b9a1002	Explicit choice feedback and logo spacing correction
63972b8	Repository hygiene, security policy and public release gate
43af5cb	Browser-only public guided runtime and deployment QA
b4d448e	Production Worker package
e7a2a18	Contest readiness, video runbook and before/after documentation
8cdaf19	Devpost copy, judge quickstart and gallery thumbnail

Codex and GPT-5.6 evidence

The required primary **/feedback Codex Session ID** is supplied directly in the private Devpost field. The README and dated commit trail identify where Codex accelerated product, engineering, design, privacy and deployment decisions. GPT-5.6 was the model used inside the core Codex build workflow; the guided judged runtime remains deterministic.

Visible Build Week evolution

This public-safe comparison deliberately distinguishes the earlier private prototype from the submitted vertical slice. Browser chrome, local paths and identity-bearing material are excluded. It is evidence of scope and productization, not a claim that the baseline itself was built during Build Week.

FROM PROTOTYPE TO PLAYABLE PRODUCT

Project DM Build Week: a private experiment became a public, guided narrative dossier.

EARLIER PRIVATE PROTOTYPE

Experimental narrative interface

BUILD WEEK PUBLIC VERTICAL SLICE

ULLDE:VERSE guided dossier

A clearer player journey: visible case state, deliberate choices, evidence, consequences and reproducible QA.

PROJECT DM / ULLDE:VERSE

The evaluated extension makes the player journey legible: a mobile dossier, visible case state, deliberate choices, evidence, persistent consequences and reproducible QA around one public world.

Technical evidence

One traceable artifact chain

Executable claims

CLAIM	EXECUTABLE EVIDENCE
World is structurally valid	qa:world validates schema and visible narrative
Choices reach distinct endings	qa:agency enumerates 1,143 routes and 9 endings
Resources are causal	qa:resources checks acquisition, use and later reads
Earlier decisions persist	qa:causal verifies five declared promises
Runtime matches the schema	qa:runtime executes all verified routes
Presentation is mobile-safe	qa:mobile checks viewport, scroll and panels
Visuals are complete	media:qa and media:coverage validate 37 assets
Public artifact matches source	qa:static compares the hosted world and Worker package
Guided play works over HTTP	qa:http executes three declared routes
Repository is public-safe	qa:repo rejects secrets, paths and runtime state

Reproduce the release gate

```
npm ci
npm test
npm start
```

*Node.js 20 or newer. No API key is required for the guided experience. The expected final line is **PROJECT DM SUBMISSION: ALL CHECKS PASSED.***
